# Section 1: Problem Statement & Solution Approach

## 1.1.Business Context

The retailer operates across 20 stores in three formats — Hypermarket (10 stores), Supermarket (5 stores), and Submarket (5 stores) — generating a total annual revenue of ₹2.09 Crore from 67,035 transactions in the Food category over 12 months (January–December 2020).

A loyalty program is in place allowing customers to earn and redeem benefits across all store formats. However, loyalty sales contribute only **24.9% of total revenue (₹51.83 Lakhs)**, significantly below the industry expected benchmark of 35–40%. This translates to a revenue gap of approximately **₹21–₹31.5 Lakhs** that the retailer is failing to capture through its loyalty program.

Two core business problems have been identified for this analysis:

1. How to increase revenue contribution from known (loyalty) customers
2. How to improve revenue contribution and customer penetration for underperforming brand

## 1.2.Data Description

The dataset comprises 67,035 point-of-sale (POS) transactions recorded across 20 retail locations between January and December 2020. It captures granular, line-item purchasing behaviors, including store format categorizations (Hypermarket, Supermarket, Submarket), product hierarchies spanning 100 unique brands, and detailed financial metrics (Quantity, Rate, and Amount). Crucially, the dataset tracks 1,000 distinct loyalty members via unique Customer IDs, providing the necessary behavioral data to isolate and diagnose loyalty penetration versus anonymous, walk-in traffic

| Variable | Description | Type | Key Stats |
|---|---|---|---|
| Trans_ID | Unique transaction identifier | Integer | 67,035 unique values |
| Store_Name | Store identifier | Text | 20 stores (STR01–STR20) |
| Store_Type | Format of store | Categorical | Hypermarket / Supermarket / Submarket |
| Category | Product category | Text | Food (single category) |
| Brand | Brand name | Text | 100 unique brands |
| Product | Product name | Text | 100 unique products |
| Cust_ID | Customer ID (NULL = non-loyalty) | Integer/NULL | 1,000 unique loyalty customers |
| Quantity | Units purchased | Integer | Range: 1–15 |
| Rate | Price per unit | Decimal | — |
| Amount | Total transaction value | Decimal | Range: ₹1.25–₹1,492 |
| Trand_Dt | Transaction date | Date | Jan–Dec 2020 |
| Month | Month of transaction | Text | 12 months |

## 1.3.Data Quality & Preparation

**Data Quality Check** - The raw dataset was examined for integrity prior to analysis. The dataset was found to be largely clean with no duplicate transaction IDs, no negative values, and no blank amount fields.

| Check | Result |
|---|---|
| Total Rows | 67,035 |
| Duplicate Trans_IDs | 0 |
| Negative Amounts | 0 |
| Blank Amount values | 0 |
| Loyalty Transactions | 16,776 (25.0%) |
| Non-Loyalty Transactions | 50,259 (75.0%) |

Four additional calculated columns were created in Excel: Loyalty_Flag, Cust_ID_Clean, Basket_Size_Category, and Brand_Flag. These enriched columns enabled more efficient SQL querying and Power BI reporting.

**Data Enrichment**- Four calculated columns were added in Excel to support analysis:

| New Column | Logic | Purpose |
|---|---|---|
| Loyalty_Flag | "Loyalty" if Cust_ID is filled, "Non-Loyalty" if blank | Segments known vs unknown customers |
| Basket_Size_Category | Low (<₹100), Medium (₹100–300), High (₹300–600), Premium (₹600+) | Classifies transaction value |
| Brand_Flag | "Underperforming" if brand revenue <0.5% of total, else "Normal Brand" | Identifies 28 low-contribution brands |
| Cust_ID_Clean | Removes decimal from Cust_ID for display | Cleaner reporting |

## 1.4.Analysis Methodology

The analysis followed a three-stage methodology: **Stage 1 — Exploratory Analysis:** Revenue distribution was examined across store types, months, loyalty vs non-loyalty segments, and brand performance using SQL aggregation queries and Excel pivot tables. **Stage 2 — RFM Segmentation:** The 1,000 loyalty customers were segmented using the RFM (Recency, Frequency, Monetary) framework. Each dimension was scored using the NTILE(4) quartile method in MySQL, producing composite scores from 3–12. Customers were assigned to four segments: Elite (10–12), Active & Engaged (7–9), At-Risk (5–6), and Lost/Inactive (3–4). **Stage 3 — Brand Performance Analysis:** Brand-level revenue contribution was calculated and brands contributing less than 0.5% of total revenue were identified as underperforming. Cross-referencing with loyalty customer purchase history identified a target list for promotional intervention.

# Section 2: Analysis Output & Findings

## 2.1.Exploratory Analysis Findings

**Finding 1 — Loyalty Gap**

Loyalty customers account for just 24.9% of total revenue (₹51.83L) despite the program having 1,000 enrolled members. Critically, the average basket size of loyalty customers (₹308.95) is nearly identical to non-loyalty customers (₹311.78), confirming that the gap is

not a spend quality problem — it is a **volume and enrolment problem**. The business has 50,259 non-loyalty transactions representing ₹1.57 Crore in unidentified revenue.

| Metric | Loyalty | Non-Loyalty |
|---|---|---|
| Transactions | 16,776 (25.0%) | 50,259 (75.0%) |
| Revenue | ₹51,82,968 (24.9%) | ₹1,56,69,556 (75.1%) |
| Avg Basket Size | ₹308.95 | ₹311.78 |
| Unique Customers | 1,000 | Unknown |

**Finding 2 — Store Type**

Loyalty penetration is uniformly low across all store formats, ranging from 24.5% (Supermarket) to 25.2% (Submarket). This indicates the loyalty gap is a **program-wide issue**, not isolated to any specific format.

**Finding 3 — Monthly Trend**

Loyalty contribution shows a gradual upward trend in the second half of the year, peaking at 27.8% in December — suggesting seasonal engagement. This trend should be leveraged for targeted end-of-year loyalty campaigns.

**Finding 4 — Brand Performance**

Of 100 brands, **28 brands contribute less than 0.5% each** to total revenue, collectively accounting for only **6.84% (₹14.26L)**. The top 5 brands (Yippee, Sprout man, Embark, Velan, Just) each contribute ~2.1%, demonstrating significant revenue concentration at the top.

| Store Type | Total Revenue | Revenue % | Loyalty Revenue | Loyalty % |
|---|---|---|---|---|
| Hypermarket | ₹93,97,774 | 45.1% | ₹23,33,200 | 24.8% |
| Submarket | ₹62,47,266 | 30.0% | ₹15,76,224 | 25.2% |
| Supermarket | ₹52,07,484 | 25.0% | ₹12,73,543 | 24.5% |

## 2.2.RFM Findings

| Segment | RFM Score | Customers | Customer % | Total Revenue | Revenue % | Avg Revenue | Avg Frequency | Avg Recency | Avg Basket |
|---|---|---|---|---|---|---|---|---|---|
| Elite | 10–12 | 263 | 26.30% | ₹23,03,541 | 44.40% | ₹8,759 | 30 | 38 days | ₹311 |
| Active & Engaged | 7–9 | 349 | 34.90% | ₹16,92,663 | 32.70% | ₹4,850 | 15.4 | 48 days | ₹343 |
| At-Risk | 5–6 | 232 | 23.20% | ₹7,95,187 | 15.30% | ₹3,428 | 10.2 | 65 days | ₹357 |
| Lost/Inactive | 3–4 | 156 | 15.60% | ₹3,91,577 | 7.60% | ₹2,510 | 7.4 | 93 days | ₹349 |

Elite customers (26.3% of base) drive 44.4% of loyalty revenue. Their average spend of ₹8,759 is **3.5× higher** than Lost/Inactive customers (₹2,510). The 232 At-Risk customers represent ₹7.95L in revenue showing early disengagement — the highest-priority re-engagement target

## 2.3.Brand Performance Findings

Of 100 brands, **28 brands contribute less than 0.5% each** to total revenue. These brands collectively account for ₹14,26,224 — just **6.84% of total revenue**. The bottom 5 brands by contribution are Mambalam Iyer (0.025%), RNA (0.028%), Safal (0.039%), Fresh Express (0.053%), and Tandoor Chef (0.066%).

In contrast, the top 5 brands — Yippee, Sprout Man, Embark, Velan, and Just — each contribute approximately 2% of revenue, highlighting significant concentration at the top.

# Section 3: Insights & Recommendations

**Opportunity 1 — Re-engage At-Risk & Lost Customers**

**Business Impact: ₹2.76L potential recovery**

388 loyalty customers (232 At-Risk + 156 Lost/Inactive) collectively contributed ₹11.86L historically but are showing disengagement. Targeted re-engagement campaigns — personalized discount vouchers for At-Risk customers and win-back offers with loyalty bonus points for Lost/Inactive — could recover an estimated **₹1.59L (20% uplift on At-Risk spend) + ₹1.17L (30% reactivation of Lost customers) = ₹2.76L** in incremental loyalty revenue.

**Action:** Send re-engagement mailers to the 232 At-Risk customers with a time-limited 15% discount voucher. For the 156 Lost/Inactive customers, offer double loyalty points for the next 3 purchases.

**Opportunity 2 — Convert High-Value Non-Loyalty Customers**

**Business Impact: ₹1.55Cr potential if 10% enrolled**

10,694 non-loyalty transactions (₹89L revenue) involve basket sizes above ₹500 — indicative of high-value, likely repeat customers. These represent the prime enrolment target. Stores with consistently high non-loyalty footfall across 6+ months (identified in SQL Query 7) should run in-store loyalty signup drives with instant-benefit incentives. Converting even **10% of non-loyalty customers into loyalty members** at the current average loyalty spend rate would generate an incremental **₹1.55 Crore** in identified revenue.

**Action:** Deploy loyalty enrolment kiosks at the top 5 non-loyalty revenue stores. Offer immediate ₹50 cashback on enrolment for transactions above ₹500.

**Opportunity 3 — Underperforming Brand Promotion**

**Business Impact: ₹14.93L uplift potential**

28 brands contribute less than 0.5% revenue each, totalling only ₹14.26L (6.84% of revenue). If targeted promotions bring each of these brands to the 0.5% threshold, total revenue from this group would reach ₹29.19L — an uplift of **₹14.93L**. The target customer list (from SQL Query 9) identifies loyalty customers who have never purchased these brands but are active buyers in adjacent categories — making them high-conversion promotion targets.

**Action:** Run 2-week "brand discovery" promotions for the bottom 10 brands through the loyalty app, offering 3× loyalty points on first purchase of each flagged brand.
